

Table 2

Risk of Malignancy Index (RMI)

RMI combines three pre-surgical features: serum CA125, menopausal status (M) and ultrasound score (U).

$$\text{RMI} = \text{U} \times \text{M} \times \text{CA125}$$

- The ultrasound result is scored 1 point for each of the following characteristics: multilocular cysts; solid areas; metastases; ascites and bilateral lesions.

U=0 (for an ultrasound score of 0)

U=1 (for an ultrasound score of 1)

U=3 (for an ultrasound score of 2-5)

- The menopausal status is scored as:

1= premenopausal

3= postmenopausal

- The classification of postmenopausal is women who have had no periods for more than one year or women over the age of 50 who have had a hysterectomy

- Serum CA125 is measured in IU/ml and can vary between 0 to hundreds or even thousands of units.

Refer to specialist multidisciplinary team if RMI > 250
